

I view my writing project as having three components:

ANALYZING A DATASET IN: either risk– environmental, disease, national security, insurance, finance OR biological/genetics related

STATISTICAL THEORY/IDEA:

COMPUTATIONAL:

As suggested by Andy, the goal of a paper as a result of my writing project. Ideally, that data set and following questions would also be driven by a “real world” problem and the statistical theory/idea that the paper is based on will be useful in many fields.

- Find 1-3 possible data sets 09/09/2016
- Data exploration and brief look (resulting in an outline) of what statistically and computationally I could look at in my writing project for each data set 09/16/2016
May take longer?
- Decision on data set and broadly what I may study 09/18/2016
- Gather material
- Research... not sure what this looks like
- Write
